20. ABSTRACT (Continue on reverse side if necessary and identify by block number)

This report provides information and analysis on the physical condition of the dam as of the report date. Information and analysis are based on visual inspection of the dam by the performing organization.

Visual observations made during the course of the inspection did not indicate any severe structural deficiency or mechanical malfunction which would adversely affect the immediate safety or stability of the dam.

DD FORM 1 JAN 73 1473 EDITION OF 1 NOV 65 IS OBSOLETE

UNCLASSIFIED

SECURITY CLASSIFICATION OF THIS PAGE (When Data Entered)

The total discharge capacity of the spillway and the regulating outlets is approximately 39,975 cfs. This is greater than the estimated Probable Maximum Flood (PMF) of 24,245 cfs, therefore, the project discharge capacity is adequate.

No remedial measures are required to assure the safety of the dam at the present time.

Some measures are recommended and included in Section 7 of the Inspection Report.

1. OVERVIEW OF SPILLWAY AND RESERVOIR VIEWED FROM RIGHT NON-OVERFLOW MONOLITH

PHASE I INSPECTION REPORT
NATIONAL DAM SAFETY PROGRAM
STILWELL LAKE DAM, INVENTORY NO. 770
HUDSON RIVER BASIN
ORANGE COUNTY, NEW YORK

SECTION 1 - PROJECT INFORMATION

1.1 GENERAL

a. Authority

The Phase 1 Inspection reported herein was authorized by the DEPARTMENT OF THE ARMY, NEW YORK DISTRICT, CORPS OF ENGINEERS by Contract No. DACW 51-78-C-0024, Modification No. P 00002, in fulfillment of the request by the Commandant, United States Military Academy in accordance with criteria specified in the National Dam Inspection Act, Public Law 92-367, 8 August 1976.

b. Purpose of Inspection

The purpose of this inspection and report is to investigate and evaluate the existing conditions of subject dam in order to: identify deficiencies and hazardous conditions; determine if they constitute hazards to human life or property; and notify the Commandant of the United States Military Academy of these results along with recommendations for remedial measures where necessary.

1.2 DESCRIPTION OF THE PROJECT

a. Description of Dam and Appurtenances

Stilwell Lake Dam is a concrete gravity dam which trends about north-south and consists of a dropped center spillway and eight non-overflow monoliths. The length of spillway is 160 feet. The height of spillway crest is at El 602.0, about 43 feet above the bedrock foundation. The lengths of the north and south non-overflow monoliths are 120 feet and 200 feet, respectively. The maximum height of the non-overflow monolith is about 61 feet above its foundation. The differential height between the top of the non-overflow monolith at El 617.8 and spillway crest is 15.8 feet.

Two spray walls are located along both sides of the spillway to contain the flows. The spray walls are extended downstream by gravity retaining walls with stone filled drains behind the walls.

Two core walls 85 feet and 35 feet long are extended from the ends of the north and south non-overflow monoliths respectively into sound rock.

An intake chamber is provided in the north non-overflow monolith approximately 46 feet north of the spillway. The chamber has two 20-inch diameter sluice gates at different elevations which control discharges through 20-inch diameter cast iron pipes. A steel "A" type hoist frame, located at the top of the chamber, can be used to lower and raise the intake screens.

A 36-inch diameter cast iron low level outlet pipe, located 15 feet south of the spillway centerline, can be used to lower the water level in the reservoir for maintenance and in the case of an emergency. A bell-mouth pipe entrance is provided with bar screen. Stoplogs are also provided to permit repairs to the valve located in the drainage and grouting gallery.

A 5-foot wide by 7-foot high drainage and grouting gallery is located in the spillway monoliths at El 565 and extends into both non overflow monoliths. Access to the gallery is provided by two gates on the downstream face of the non-overflow sections. Pipes, 3 inches in diameter on 5-foot centers, have been drilled for the purpose of creating a grout curtain. Pressure relief pipes, 6 inches in diameter on 20 foot centers, are provided near the downstream face of the gallery wall with outlets draining into a gutter. Seepage collected in the gutter can be emptied through two 6-inch diameter drains leading to the downstream face of the spillway.

b. Location

The dam is located approximately 5 miles southwest of the United States Military Academy, about 2 1/2 miles west of the town of Fort Montgomery.

c. Size Classification

The dam is greater than 40 feet high but less than 100 feet high, therefore, classified as an "intermediate" dam.

d. Hazard Classification

The dam is in the "significant" hazard potential category because of the few isolated homes located a short distance downstream from the dam.

e. Ownership

Stilwell Lake Dam is owned by the United States Military Academy. The day-to-day operation and maintenance of the operating facilities is managed by the Water Plants Section of the Utilities Division. The maintenance of the dam is managed by the Buildings and Structures Section of the Buildings and Grounds Division. Both Divisions are directly responsible to the Directorate of Facilities Engineering, United States Military Academy.

f. Use of Dam

The impoundment provided by the dam is for water supply and recreational purposes.

g. Design and Construction History

The dam was designed by Alexander Potter Associates, Architect-Engineers of New York City. It was constructed and completed in November, 1948 by the U.S. Army Corps of Engineers. Design data, calculation and as-built drawings can be obtained from the Directorate of Facilities Engineering, United States Military Academy.

h. Normal Operating Procedures

The water level in the reservoir is usually maintained to the spillway crest with the upper sluice gate open. During September to April, water passes over the spillway crest with flashboards in the open position.

1.3 PERTINENT DATA

a. Drainage Area (square miles)	12.5
b. Discharge at Dam Site (cfs)	
Maximum regulating gate outlets	285
Ungated Spillway at maximum pool, El 617.8	39,690
Total Spillway capacity at maximum pool, El 617.8	39,975
c. Elevation (feet above MSL)	
Top of Dam	617.8
Maximum pool-design surcharge	617.8
Crest of Spillway (ungated)	602
Streambed at centerline of dam	560
d. Reservoir (miles)	
Length of Maximum pool	0.75
e. Storage (acre-feet)	
Crest of Spillway, El 602	1920
Top of dam, El 617.8	9465
f. Dam	
Type:	Concrete gravity
Length:	480 feet
Height:	58 feet ±
Side Slopes:	Upstream: vertical at top 8V on 1H at bottom Downstream: 10V on 8H
Top Width:	9.67 feet
Grout Curtain:	3-inch diameter grout pipes spaced at 5 foot centers

g. Spillway

Type:	Concrete Ogee Weir section
Length:	160 feet
Crest Elevation:	602

h. Regulating Outlets

Two 20-inch diameter sluice gates are located at El 592 and El 585. They are connected to a common 20-inch diameter cast iron pipe with its outlet at El 565.5. A gate valve is provided to regulate the discharge.

A 36-inch diameter cast iron pipe is located at El 562. A valve is provided in the drainage and grouting gallery to regulate the discharge.

SECTION 2 - ENGINEERING DATA

2.1 DESIGN

Design data, engineering information and as-built drawings are available for evaluation of the original design of the dam. There are no records available of any design changes to the dam.

2.2 CONSTRUCTION RECORDS

There are no construction records available for the project.

2.3 OPERATION RECORDS

There are no operation records available.

A record of reservoir elevation and rainfall are kept daily and are available at the Lusk Reservoir Water Treatment Plant.

2.4 EVALUATION OF DATA

Information and drawings were made readily available by personnel of the Water Plants Section of the Utilities Division and the Civil Section of the Engineering Plans and Services Division; Directorate of Facilities Engineering, United States Military Academy.

The information obtained from available data, the personal interviews and the visual inspection are considered adequate for this Phase I inspection and evaluation.

SECTION 3 - VISUAL INSPECTION

3.1 FINDINGS

a. General

A visual inspection of Stilwell Lake Dam was made on December 5, 1978. At that time the reservoir level was at El 599±, about 3 feet below spillway crest.

Water was discharging from the 20-inch diameter cast iron pipe into the spillway bucket. The water level at the bucket was maintained at the top of bucket sill by discharges from two 12-inch diameter drain pipes leading into the downstream channel.

Flashboards on the spillway crest were in an upright position except for those on the monolith adjacent to the north (left) non-overflow monoliths which were in a horizontal position.

b. Dam

Both north and south non-overflow monoliths were in good condition. No displacements of the horizontal and vertical alignments were observed. There was some white mineral deposition along horizontal joints on the downstream face of the dam. No seepage and/or leakage were observed.

c. Spillway

On the downstream face, there was some deterioration of concrete existing in the area near the crest.

There was some spalling along the horizontal and vertical joints. The horizontal joint above the 36-inch diameter low level outlet pipe appears to have a wide gap. There was wetness existing on the concrete face below this gap, but no seepage was detected. Grass was growing along one of the vertical joints.

The wooden flashboards were in deteriorating condition. It was reported that the owner is planning to replace them. It is also reported that an accessway will be installed between the spillway crest and the top of the dam.

d. Appurtenant Structures

The two 20-inch diameter sluice gates in the intake chamber were found to be in operating condition. Downstream, opposite the intake chamber, a 20-inch diameter gate valve and a flow indicator were provided. It appears that the flow indicator is now abandoned and the stem and wheel of gate valve are rusted. It is reported that this gate valve is kept open all the time.

A 36-inch diameter valve located in the drainage and grouting gallery was found well maintained. The valve was closed at the time inspected. It was reported that an original butterfly valve was replaced in 1974.

Inside the drainage and grouting gallery, water has collected to approximately one inch deep. The gutter was full of water and silt. Significant amounts of silt and debris were found deposited near the south end of the gallery to the degree that the two 6-inch diameter gutter drains were blocked. No leakage was observed through joints. On the downstream side of the gallery wall, the entire surface below the first horizontal joint was found wet and covered by white mineral deposits. The entrance gates to the gallery were locked and in good condition.

The railings along south retaining walls were rusted with paint completely peeled off. The lock on the south entrance gate on the top of the dam failed to open with the key inserted.

e. Downstream Channel

Riprap protection is provided on the south (right) bank of the channel. Some debris, broken concrete pipes and bushes were found in the downstream channel.

3.2 EVALUATION OF OBSERVATIONS

Visual observations made during the course of the inspection did not indicate any severe structure deficiency or mechanical malfunction which would adversely affect the immediate safety of the dam. However, there is continuous need of inspection, maintenance and repair programs.

SECTION 4 - OPERATIONAL AND MAINTENANCE PROCEDURES

4.1 PROCEDURES

During the months of September to April, water passes over the spillway crest with the flashboards open. During May to September the upper sluice gate is opened to maintain the water level about one inch over the spillway crest.

The 36-inch diameter valve located in the drainage and grouting gallery is usually kept closed. This valve is opened when it is desired to maintain the reservoir level not higher than one foot above flashboards so that the flashboards will stay in an upright position.

4.2 MAINTENANCE OF THE DAM

There is no operation and maintenance manual for the dam; however, present maintenance of the project appears adequate.

4.3 MAINTENANCE OF OPERATING FACILITIES

The two 20-inch diameter sluice gates, at the intake chamber, and the 36-inch diameter valve in the drainage and grouting gallery, appear to be in acceptable operating condition. An original 36-inch diameter butterfly valve was replaced in 1974.

Records of daily operation of gates are kept in the office.

4.4 DESCRIPTION OF WARNING SYSTEM IN EFFECT

An electric water level indicator is located at the Water Plant and automatically registers reservoir level. If deemed necessary, Plant personnel will report conditions to a higher authority by telephone communications.

4.5 EVALUATION

There appears to be nothing in the present operational or maintenance procedures which would adversely affect the safety of the project. Overall maintenance of the dam and appurtenant features is considered to be adequate.

SECTION 5 - HYDRAULIC/HYDROLOGIC

5.1 DRAINAGE AREA CHARACTERISTICS

Stilwell Lake is the last significant lake on Popolopen Brook before the Brook enters the Hudson River. The watershed of Stilwell Lake has a maximum length of 6.4 miles in the NE-NW direction and a maximum width of 2.6 miles. The entire watershed, which is wooded and includes many lakes and ponding areas, occupies 8021 acres (12.53 square miles). About 45% (3630 acres) of the area is controlled by Popolopen Lake, the outflow of which, to a degree, is attenuated again, by Mine Lake before entering Stilwell Lake. Mine Lake and a number of other lakes and ponding areas control an additional 29% (2349.2 acres) of the watershed so that flow from only 2041.8 acres can be considered as uncontrolled flow entering Stilwell Lake. It is estimated that the available storage, in the lakes upstream of Mine Lake, a 480.9 acre-feet could attenuate up to 4.64 inches of runoff over that partial area. The estimated available storage over the entire basin of 12.53 square miles is about 3780 acre-feet which is equivalent to approximately 5.5 inches of runoff.

5.2 SPILLWAY CAPACITY

Normal discharges from Stilwell Lake is possible through two low level valve controlled 20-inch diameter cast iron pipe outlets. The spillway is 160 feet in length with an "ogee" shaped crest and has a computed maximum discharge (water level El 617.8) of 39,690 cfs. It is estimated that with the water surface at El 602 the discharge capacities of the 20-inch diameter and 36-inch diameter pipes are 71 cfs and 214 cfs respectively.

5.3 RESERVOIR CAPACITY

According to an available as-built drawing[1] the maximum reservoir capacity (El 617.8) is given as 1455 million gallons or 4465 acre-feet. It is estimated that the surcharge storage between spillway crest El 602 and El 617.8 is 2541 acre-feet.

5.4 FLOODS OF RECORD

There are no stream gages or records of major floods for the Popolopen Brook Watershed. Flow records for gages in the Wallkill River basin indicate that the worst flooded recorded was October 16, 1955.

5.5 DESIGN FLOOD

Because there are no data available on floods for the Popolopen Brook

it was necessary to synthesize the Standard Project Flood.

The Probable Maximum 6-hour rainfall for the United States Military Academy area is 24.4 inches[2]. This amount, adjusted[3] for conformity of generalized isohyetals (in Reference 2) with the shape of the watershed, becomes 19.52 inches. The inflow is based on the sum of the flows entering Stilwell Lake from the directly contributing area (2041.8 acres), the lake area (131 acres), and the outflow from Mine Lake. Inflow to Mine Lake is based on the sum of the flows from the directly contributing area (777 acres), the lake area (24.5 acres), the upstream area affected by ponding (1171 acres), and the outflow from Popolopen Lake. Unit hydrographs, based on the Snyder method[4], and using $C_T = 2$ and 640 $C_p = 400$, were developed for sub-basins VI, VII and X. Flows from all other areas were computed by the instantaneous conversion of excess rainfall to runoff because of the small contributing drainage areas and the negligible lag time. A loss of 0.2 inches per hour was applied to all rainfall over the land areas. The runoff volume equal to the estimated retention capacity of each ponding sub-area was subtracted from the beginning of the flood runoff and in each case the remaining runoff was lagged appropriately before it was added to form the inflow to Mine Lake. The inflow peaks of the Probable Maximum Flood and the Standard Project Flood to Stilwell Lake are 26,291 cfs and 10,170 cfs respectively.

The potential of the dam being overtopped was investigated on the basis of the available surcharge storage and spillway discharge capacity to meet a potential emergency inflow. It was assumed that the lake levels were at spillway crest elevation (Mine Lake El 648.63, and Stilwell Lake El 602) at the start of the flood inflow and the low level outlets were closed during the occurrence. The maximum capacity of the spillway on Mine Lake was calculated to be 1420 cfs. The computed discharge of the Stilwell Lake spillway with the water level at El 617.8, equivalent to the top of the dam, is 39,690 cfs.

5.6 EVALUATION

The PMF and SPF were routed through the lakes using a computerized technique, and resulted in a maximum lake elevation of 613.35 and 607.97 for the PMF and SPF respectively, and with peak outflows of 24,245 cfs and 9232 cfs respectively.

The PMF peak outflow is about 61% of the computed spillway capacity and the spillway is therefore considered adequate.

SECTION 6 - STRUCTURAL STABILITY

6.1 EVALUATION OF STRUCTURAL STABILITY

a. Visual Observations

Visual observations did not indicate either existing or potential conditions which would adversely affect the safety or structural stability of the dam.

b. Design and Construction Data

Stability design calculations and other engineering data are available from the Directorate of Facilities Engineering, United States Military Academy.

c. Operating Records

The dam has never been overtopped. Thc daily records of reservoir elevations and operation of gates are kept and available at the Water Plant.

d. Post-Construction Changes

There are no records of any post-construction changes except for the 1974 replacement of the 36-inch diameter butterfly valve in the drainage and grouting gallery.

e. Seismic Stability

The dam is located in Seismic Zone No. 1, therefore, no seismic analyses are warranted.

6.2 REVIEW OF STABILITY COMPUTATIONS

The original stability calculations indicated that 50% of the head was assumed for the uplift along the base of the dam. This is not in accordance with the present design practice indicated on Chapter 2, paragraph 2-04 of EM 1110-2-2200, revised November 23, 1960, published by the Corps of Engineers, U.S. Army.

Using the above criteria with an assumed maximum 50% drain efficiency, it is found that for the Design Loading Case III, water surface at El 617.8, the sliding factor would be 0.98. This is greater than 0.65 allowed by the criteria specified in Chapter 3, paragraph 3-03 of the above mentioned manuals.

It should be noted that the water surface for the Probable Maximum Flood (PMF) is 4.5 feet below that assumed for Design Loading Case III. Thus, the sliding factor for the case of PMF would be less than 0.98. In view of the fact that its severity, short duration and unusual occurrence

in nature, the safety against sliding can be considered not critical. Therefore, the stability of the dam is considered adequate.

SECTION 7 - ASSESSMENT/REMEDIAL MEASURES

7.1 DAM ASSESSMENT

a. Safety

Visual observations made during the course of the inspection did not indicate any severe structural deficiency or mechanical malfunction which would adversely affect the immediate safety or stability of the dam.

The total discharge capacity of the spillway and the regulating outlets is approximately 39,975 cfs. This is greater than the estimated Probable Maximum Flood (PMF) of 24,245 cfs, therefore, the project discharge capacity is adequate.

b. Adequacy of Information

Information and data available are considered adequate for the performance of this investigation.

Records of previous inspections made in April 1976 were not available at the time of this Phase I inspection.

7.2 REMEDIAL MEASURES

No remedial measures are required to assure the safety of the dam at the present time.

Certain measures are recommended as follows:

a. Deteriorated concrete surface and spalling along joints should be monitored so that the repairs can be made when needed.

b. Silt and debris deposited in the drainage and grouting gallery should be removed. The two 6-inch diameter gutter drains should be cleaned to ensure the free-passage of water collected in the gallery.

c. Establish an observatio . and monitoring program of the pattern and quantity occurring on the downstream side of the gallery wall.

d. Establish a program of periodic inspections of the project features.

e. Prepare an Operation and Maintenance Manual.

ENGINEERING DATA CHECKLIST

APPENDIX C

CHECKLIST
ENGINEERING DATA
DESIGN, CONSTRUCTION, OPERATION
PHASE I

NAME OF DAM STILWELL LAKE

ID # 770

ITEM	REMARKS
AS-BUILT DRAWINGS	see Appendix for list of drawings available.
REGIONAL VICINITY MAP	U.S.G.S
CONSTRUCTION HISTORY	Construction procedures and diversion schemes were discussed in design Report.
TYPICAL SECTIONS OF DAM	Concrete gravity section see drawings NOS. 7512-468, 7512-469.1
OUTLETS-PLAN	see Dwg. 75-12-455.1
-DETAILS	20 inch dia. C.I. pipe controled by two sluice gates, 36 inch dia. blow-off controled by valve in the gallery
-CONSTRAINTS	None. there is a 20 inch dia. intake pipe at Queensboro Furnace for water supply to Lusk Reservoir.
-DISCHARGE RATINGS	available, see Dwg. 7512-464
RAINFALL/RESERVOIR RECORDS	Available at Water Plant.

ITEM	REMARKS
DESIGN REPORTS	Available from Alexander Potter Associates, New York City
GEOLOGY REPORTS	Same as above
DESIGN COMPUTATIONS	Same as above
HYDROLOGY & HYDRAULICS	
DAM STABILITY	
SEEPAGE STUDIES	None available
MATERIALS INVESTIGATIONS	See Design Reports above
BORING RECORDS	
LABORATORY	
FIELD	
POST-CONSTRUCTION SURVEYS OF DAM	None available
BORROW SOURCES	unknown

ITEM	REMARKS
MONITORING SYSTEMS	Level indicator installed at office of Water Plant.
MODIFICATIONS	None except that 36 inch diameter valve in gallery was replaced in 1974.
HIGH POOL RECORDS	Dam has not been overtopped. Reservoir elevations are recorded by leve indicator.
POST CONSTRUCTION ENGINEERING STUDIES AND REPORTS	None
PRIOR ACCIDENTS OR FAILURE OF DAM DESCRIPTION REPORTS	None
MAINTENANCE	previous inspection was made in April, 1976.
OPERATION RECORDS	upper sluice gate is usually open, reservoir level is normally maintained near spillway crest. Records of gate and valve opening is maintained. No operation and maintenance Manual

ITEM	REMARKS
SPILLWAY PLAN	
SECTIONS	Concrete ogee weir section
DETAILS	See drawing NO. 7512-467
OPERATING EQUIPMENT	Gates and valve are hand operated.
PLANS & DETAILS	none

VISUAL INSPECTION CHECKLIST

APPENDIX D

VISUAL INSPECTION CHECKLIST

1. Basic Data

a. General

Name of Dam Stilwell Lake Dam Hazard Category Significant

County Orange ID# 770

Stream Name Popolopen Creek Tributary of Hudson River

Location Orange County Nearest Town (P.O.) Fort Montgomery

Longitude 74°-01'-57" Latitude 41-20'-39" Other Directions

about 5 miles S.W. of West Point, 600 ft. S.E. of Rt. 293 and Mine Torne Rd.

Date of Insp Dec. 5, 1978 Weather Sunny - Cloudy Temperature 45°F

b. Inspection Personnel T.C. Chiang - Structural Engineer

M.A. Marino - Geotechnical Engineer

c. Persons Contacted

John O'Connor, Kenneth J. Tomann R. Hunjan of Civil Engineer of U.S.M.A.

Jim McDonald, water plant forman USMA

d. History: Date Constructed Nov. 1948

Present Owner U.S.M.A

Designed by Alexander Potter Associates, new York C

Constructed by U.S. Army Corps of Engineer

Recent History

2. Technical Data

Type of Dam Concrete Gravity Drainage Area 8021 Acres

Height 52 ft Length 650 ft

Upstream Slope vert. Downstream Slope 10 (1) on 8 (1)

Top Crest Width 9'-8" Bottom Freeboard at Spillway Crest 15.8 ft

Low Level Control: (Type and Size) 36" C.I. Pipe

Valve Condition Good condition, replaced in 1974

~~Emergency~~ Spillway Type (Material) Concrete Ogee Weir Width 160 feet

Side Slopes (See drwgs)

Height (Crest to Top) of Dam 15.8 feet

Exit Slope (See drwgs)

Exit Length (See drwgs)

Ponded Surface Area _____ Acres

Capacity (Normal Level) 1924 Acre Feet

Capacity ~~Emergency~~ Spillway Level 1924 Acre Feet

3. Embankment

Not applicable – Concrete Gravity Dam

a. Crest

(1) Vertical Alignment

(2) Horizontal Alignment

(3) Longitudinal Surface Cracks

(4) Transverse Surface Cracks

(5) General Condition of Surface

(6) Miscellaneous

b. Upstream Slope Not applicable

(1) Undesirable Growth or Debris

(2) Sloughing, Subsidence, or Depressions

(3) Slope Protection

(a) Condition of Riprap

(b) Durability of Individual Stones

(c) Adequacy of Slope Protection Against Waves and Runoff

(d) Gradation of Slope Protection - Localized Areas of Fine Materia

(4) Surface Cracks

c. Downstream Slope

(1) Undesirable Growth or Debris

(2) Sloughing, Subsidence, or Depressions; Abnormal Bulges or Non-Uniformity

Not applicable

(3) Surface Cracks on Face of Slope

(4) Surface Cracks or Evidence of Heaving at Embankment Toe

(5) Wet of Saturated Areas or Other Evidence of Seepage on Face of Slope; Evidence of "Piping" or "Boils"

(6) Fill Contact with Outlet Structure

(7) Condition of Grass Slope Protection

d. Abutments

(1) Erosion of Contact of Embankment with Abutment from Surface Wate... Runoff, Upstream or Downstream

(2) Springs or Indications of Seepage Along Contact of Embankment with the Abutments

(3) Springs or Indications of Seepage in Areas a Short Distance Downstream of Embankment -- Abutment Tie-in

Not applicable

c. Area Downstream of Embankment, Including Tailrace Channel

(1) Localized Subsidence, Depressions, Sinkholes, Etc.

(2) Evidence of "Piping" or "Boils"

(3) Unusual Presence of Lush Growth, such as Swamp Grass, etc.

(4) Unusual Muddy Water in Downstream Channel

(5) Sloughing or Erosion

(6) Surface Cracks or Evidence of Heaving Beyond Embankment, Toe

(7) Stability of Tailrace Channel Sideslopes

(8) Condition of Tailrace Channel Riprap

(9) Adequacy of Slope Protection Against Waves, Currents and Surface Runoff

(10) Miscellaneous

f. Drainage System

(1) Condition of Relief Wells, Drains and Appurtenances

(2) Unusual Increase or Decrease in Discharge from Relief Wells

4. Instrumentation

None

(1) Monumentation/Surveys

(2) Observation Wells None

(3) Weirs None

(4) Piezometers None

(Other)

5. Reservoir

water elevation at El. 599 or 3 ft below spillway crest at time of inspection.

a. Slopes Portions of reservoir slopes visible from the dam show no signs of distress, instability or other adverse conditions

Both banks immediate u/s of dam are well protected by riprap.

b. Sedimentation Not visible

6. Spillways

Ungated spillway with 5 ft flashboard, 4 monoliths width 160 ft.

a. Principal Spillway: Inlet Condition

Pipe Condition

General Remarks (include information such as recently repaire potential for debris accumulation, special items of note, etc.)

Crest at el. 602, Some minor deterioration of concrete near crest existed. No repair has been made. Spillway is in good condition. Flashboards at first left monolith were in horizontal position, all others were in upright positin

~~b. Emergency Spillway: General Condition~~ Owner is contemplating to replace flash boards and also to provide access from top of non-overflow monolith (El. 617.8) to spillway crest.

Tree Growth Some debris and bushes existed in the downstream of channel.

Erosion No erosion observed

Other Observations 36"ϕ Blow-off is closed. Two 12"ϕ C.I. drains for Bucket are working properly water @ d/s of Spillway is retained to top of s

7. Structural (if required) See Attached Appendix

8. Downstream Channel

Immediate right bank has good riprap protection while the left bank has rock outcrop.

a. Condition (obstructions, debris, etc.) There is no concrete apron beyond the dam. The stream bed is full of rocks and stones. Some debris existed but constitute no obstruction. There are a line of trees along o/s face of right non-overflow monoliths.

b. Slopes appeared to be stable.

c. Approximate No. Homes and Population

Few houses within 2 miles could be affected by a flood.

d. General

Nair Nair
TEAM CAPTAIN

STRUCTURAL INSPECTION CHECKLIST

PHASE I DAM INSPECTION

1. Concrete Surfaces Minor deterioration at D/S face near spillway crest. Some spalling along horizontal joints of Spillway. Some white mineral deposit along horizontal joint above Gallery entrance gate at right non-overflow Monolith. Overall condition is good.

2. Structural Cracking None observed.

3. Movement - Horizontal and Vertical Alignment None observed.

4. Junctions with Abutments or Embankments good condition

5. Drains - Foundation, Joint, Face foundation drains not visible. Two 12"ϕ Bucket drains and 20"ϕ C.I outlet from intake chamber are in good working conditions.
6"ϕ drains in gutter of Gallery are clogged by silt, 1" deep water in gallery

6. Water Passages, Conduits, Sluices No overflow from spillway. 36"ϕ Blow-off is closed. Two 20"ϕ Sluice gates in Intake Chamber. Lower one is closed, ~~while the upper one is open. water flows out from~~ 20"ϕ C.I. Pipe.

7. Seepage or Leakage No seepage or leakage observed. there are white mineral deposit along D/S face wall of Gallery.

8. Monolith Joints - Construction Joints In general, good condition. Some spalling along horizontal joints of Spillway.

9. Foundation D/S face of dam covered by dirt and leaves. Left bank has rock outcrop. Dam foundation found to be typical granite gneiss.

10. Abutments No defect or damage observed.

11. Control Gates Two 20"ϕ sluice gates at two levels are located at Intake Chamber to permit withdrawal of water through 20"ϕ C.I Pipe. Gates are in operating condition.

12. Approach and Outlet Channels well protected by riprap.

13. Stilling Basin Not applicable

14. Intake Structure located at left non-overflow monolith to house two 20"ϕ sluice Gates "A" type steel hoist frame and other maintenance features are in good condition

15. Settlement None.

16. Stability

a. Overturning There is no adverse effect to the stability.

b. Sliding Shear-friction resistance should be investigated

c. Seismic Not significant - Seismic Zone No. 2

17. Instrumentation

a. Alignment None

b. Uplift

c. Seismic

18. Miscellaneous

TAMS

Job No. 1467-13 Sheet 16 of _____

Project INSPECTION STILLWELL LAKE Date DEC 4 - 1970

Subject U/H for Loop Hydrograph sub-b. VI -- INFLOW INTO STILLWELL LAKE. By D.L.C.

Ch'k. by _____

AREA 1.79 sq miles 1146.2 acres

L = 2.42 miles L_{CA} = 1.10 miles

Assume $C_T = 2.0$ & $640 C_p = 400$

$t_p = C_T (L L_{CA})^{0.3}$ = 2.68 hrs

$t_r = t_p / 5.5$ = 0.49 hrs Use 0.50.

$q_p = 640 C_p / t_p = \frac{400}{2.68}$ = 147.25

Q_p = 149.25 x 1.79 = 267.2 CFS.

Sub-basin VI

AREA = 0.728 sq mi / 465.9 acres

L 1.33 miles. L_{CA} = 0.44 miles.

Assume $C_t = 2.0$ $640 C_p = 400$.

t_p = 0.85 $t_r = t_p / 5.5$ = 0.15 Use t_R = 0.25

t_{p_R} = 0.85 + 0.25(.25 - .15) = 0.85 + .025

= 0.875 hrs / 52.5 min

$q_{p_R} = 640 C_p / t_{p_R} = \frac{400}{0.875}$ = 457. cfs/sq mi.

Q_p = 332.7 CFS.
